Whoami — Project Overview

Personal Life OS: one secure app replacing budgeting, journaling, calendar, notes, reminders, and AI.

✓ Phases 1–5 Complete

WHAT IS WHOAMI?

Whoami is a full-stack personal operating system built as a single secure web application. It replaces fragmented tools — Mint, Day One, Google Calendar, Notion, Reminders, and AI assistants — with one unified platform that never shares data with third parties.

All data lives in a private PostgreSQL database. Authentication uses Argon2id + JWT sessions. Every module is built with TypeScript strict mode, Next.js 16 App Router, and a dark-first UI with indigo/violet accents.

TECH STACK

Next.js 16 · React 19 · TypeScript strict · Tailwind CSS v4 · PostgreSQL (Neon) · Prisma 7 · NextAuth v5 · Vercel

SECURITY STACK

- Argon2id password hashing
- JWT sessions · httpOnly cookies
- 7 security headers via middleware
- Rate limiting (5 attempts / 15 min / IP)
- Zod validation on all inputs
- Audit logging to database
- Journal PIN with 5-attempt erase

Phase Roadmap

Phase 1 — Foundation
Auth, dashboard shell, DB schema, security headers, rate limiting, audit logs
✓ Complete

Phase 2 — Budget
Plaid sync, transactions, 14 categories, budgets, subscriptions, savings goals, cash flow, net worth
✓ Complete

Phase 3 — Journal
TipTap editor, mood tracking, tags, calendar view, PIN lock (session-only, 5-attempt erase)
✓ Complete

Phase 4 — Calendar & Reminders

Phase 5 — Analytics

Phase 6 — Notes

Google Calendar sync, iCal import, month/week/day views, standalone reminders page, two-way event push

✓ Complete

Mood chart, journal frequency, budget breakdown, savings progress, net worth card, cash flow chart

✓ Complete

Full CRUD notes with color themes, tags, pin, auto-save, sidebar search/filter, two-pane editor

✓ Complete

Phase 7 — AI Assistant

Context-aware AI using Claude API — answers questions about your finances, mood, and calendar

◦ Upcoming

Phase 8 — Advanced Modules

Habit tracking, goal timeline, health integration, sleep logs
